Project Mu: Fresh Save Strategy & Remote PC-WSL Migration Plan

1. Executive Summary & Core Decision

The Dilemma: 2036 PS5 Universe Migration vs. Fresh PC Madden 27 Save

The original PC migration roadmap (`PC_MIGRATION_PLAN.md` §4) was designed to teleport 11 seasons (2026–2036) of PS5 universe history into a Madden 27 PC franchise at the 2037 offseason using an identity-swap teleporter (`pipeline/teleport.py`).

However, two compelling game-balance and technical realities favor starting a **fresh save**:

1. **Gameplay & Sim Mods Compatibility**: Installing gameplay overhauls and realistic sim-stat balance mods on PC alters completion rates, rushing averages, sack rates, and yardage baselines. Appending modded stats directly onto 11 years of unmodded PS5 stats would create distorted historical anomalies and make active players look suddenly regressed across seasons.
2. **Franchise Competitive Balance**: By 2036, the Carolina Panthers franchise had become an unstoppable 99 OVR powerhouse with surplus cap space and zero losses since 2034, eliminating franchise stakes. Starting fresh (with the Indianapolis Colts or another chosen franchise) restores meaningful front-office tension, scouting stakes, and authentic team building.

---

2. Key Architecture Takeaways & Completed Work

2.1 Clean Database Provisioning (`db/seed_clean_db.py`)

To enable an instantaneous fresh start without remnants of 2036 data, `db/seed_clean_db.py` bootstraps a clean PostgreSQL instance with:

- **32 NFL Franchises**: Canonical team colors, division alignments, and home venues.
- **League State Initialization**: Configurable target season and week (`current_season`, `current_week`).
- **User-Team Front Office Settings**: Configurable user control flags via `--user-team` (e.g. `IND`).

- **NFL Baseline Record Book**: Real historical NFL record book through 2025 (544 franchise marks, 600 top-10 league records).
- **32 Real NFL Head Coaches & 64 Coordinators**: Authentic schemes (West Coast, Wide Zone, Spread), play-calling tendencies, pass/run leans, and starting tenures.
- **32 Front Office GMs & Draft Capital**: Complete GM personas with 3 future draft classes (672 picks across 7 rounds) in `draft_picks`.
- **192+ Newsroom Media Writers**: Complete persona database (`personas`, `persona_sliders`, `persona_traits`) for localized beats and national journalists.
- **Napper Fantasy Platform**: Clean fantasy platform schema and default profile (`jrereyi2000`).

2.2 Save Listener Auto-Provisioning (`pipeline/watch_save.py --auto-init`)

`pipeline/watch_save.py` has been upgraded with automated zero-touch provisioning:

- **Automatic Detection**: Listens to the Madden PC save directory (`CAREER-*`) and debounces file bursts.
- **Save State Extraction**: Inspects the save via `pc_save_reader.mjs` to extract calendar season and starting stage/week.
- **Zero-Touch Seeding**: When pointed at an unseeded database or detecting a new franchise reset, `--auto-init` automatically calls `db/seed_clean_db.py:run_clean_seed` using the exact season and week from the save file.
- **Snapshot Ingestion**: Automatically loads all 32 team rosters, players, contracts, and schedule from the Madden 27 save snapshot without manual intervention.

2.3 Draft Prospect Generation & Narrative Architecture

Draft prospect progression is handled by a layered four-part architecture:

1. **Madden Internal Class Generation**: Madden Franchise auto-generates 450 prospects in **Regular Season Week 3** into `Player` (`ContractStatus = "Draft"`) and `DraftPlayer` (`DraftPosition`, `InitialDraftRank`, `TrueOverallRanking`). Alternatively, custom classes from **EA Sports College Football 27 (CFB 27)** can be exported into the save.
2. **Scouting Engine & Hidden Value VVV** (`engines/scouting_engine.py` & `engines/scouting_value.py`): Prospects are assigned true hidden talent VVV. Over 27 weekly steps, media draft boards (Kiper, McShay, Jeremiah) and scout evaluations fluctuate as signals of VVV are gradually revealed.
3. **Simulated College Narratives** (`engines/scouting_events.py`): In-season simulated college game logs against conference rivals (anchored in

`data/scouting/colleges.json`), national awards (Davey O'Brien, Doak Walker, Biletnikoff, Outland, Bednarik, Thorpe), bowl game performances, and NFL Combine / Pro Day drills (40-yard dash, vertical jump, bench press).

4. **PC Teleport Sync** (`pipeline/teleport_draft.py`): Optimal assignment (Hungarian algorithm) that maps Project Mu's customized prospects and traded pick ownership back into Madden binary saves.

---

3. Comparison: Fresh Save vs. 2036 Teleporter Migration

Dimension	Option A: Full 2036 Teleporter Migration	Option B: Fresh Save with Auto-Init (Recommended)
Setup Complexity	**Very High**: Requires running `pipeline/teleport.py`, Hungarian donor matching, 30,000+ attribute edits, commentary voice renames, and zstd skin-tone decompression.	**Minimal**: Madden creates clean save; `watch_save.py --auto-init` provisions the DB and loads rosters in seconds.
Gameplay / Sim Mods	**High Risk**: Mod balance changes will clash with 11 seasons of unmodded PS5 stats, distorting career averages and causing apparent cross-season regressions.	**Clean**: Modded gameplay and sim statistics define the universe baseline from Year 1 onward.
Competitive Stakes	**Low**: 2036 Panthers are 99 OVR with excessive cap space and an undefeated multi-year run.	**High**: Fresh Colts (or chosen team) franchise with realistic rebuild challenges, draft strategy, and cap management.
History & Records	Preserves 11 seasons of fictional history (2026–2036) alongside real NFL history.	Preserves full real NFL history through 2025; starts fresh franchise continuity from 2026/2027.
Pipeline Reliability	Vulnerable to Madden 27 patch changes in donor player structures or depth chart overflows.	Uses standard `load_save.py` native read path, identical to regular weekly runs.

---

4. Execution Plan for Remote Host `pc-wsl`

The target machine is `pc-wsl` (`192.168.1.202`) running Windows 11 with WSL2 (Ubuntu), housing the Madden 27 installation and modded environment.

4.1 SSH Connectivity Prerequisite

- **Current State**: Host entry `pc-wsl` is configured in `~/.ssh/config` pointing to `192.168.1.202` with user `jrereyi`.
- **Status**: SSH connection currently reports `Permission denied (publickey,password)`.
- **Required Action**: Copy the Mac's public key (`~/.ssh/id_ed25519.pub`) into `/home/jrereyi/.ssh/authorized_keys` on `pc-wsl`:
  bash
- ssh-copy-id -i ~/.ssh/id_ed25519.pub jrereyi@192.168.1.202

4.2 Remote Setup Steps (via SSH MCP Tool)

Once SSH authorization is active, the following automated setup will be executed directly through `pc-project-mu` tools:

1. **Repository Synchronization**:
   - Clone or rsync `/Users/jrereyi/Downloads/Project Mu` to `/home/jrereyi/Project Mu` on `pc-wsl`.
2. **Environment & Database Provisioning**:
   - Install PostgreSQL 16/17 and create database `madden`:
     bash
   - sudo apt update && sudo apt install -y postgresql postgresql-contrib python3-venv python3-pip
   - sudo -u postgres createuser -s jrereyi || true
   - sudo -u postgres createdb madden || true
   - Set up Python virtual environment and install dependencies:
     bash
   - python3 -m venv venv && source venv/bin/activate
   - pip install -r requirements.txt
3. **Node.js Reader Setup**:
   - Install Node.js (v18+) and install `pipeline/save_reader` dependencies:
     bash
   - cd /home/jrereyi/Project\ Mu/pipeline/save_reader
   - npm install

4. **Locate Madden PC Saves Directory**:
    - In WSL2, Windows user documents are mounted at `/mnt/c/Users/<WindowsUser>/Documents/Madden NFL 27/saves/`.
    - Export this path in `/home/jrereyi/Project Mu/.env`:
      env
    - MADDEN_SAVES_DIR="/mnt/c/Users/jrereyi/Documents/Madden NFL 27/saves"
    - DATABASE_URL="host=localhost dbname=madden user=jrereyi password=postgres"
5. **Start Auto-Provisioning Watcher Daemon**:
   bash
6. python3 -m pipeline.watch_save "$MADDEN_SAVES_DIR" --auto-init --user-team IND
    - When the user starts a new franchise in Madden 27 on Windows and saves, the watcher debounces the write, extracts season & week, runs `seed_clean_db.py`, ingests all players/contracts/schedule, runs preseason calibration engines, and notifies the phone via ntfy!
